The blue color of the sky is due to the scattering of light by small particles of the atmosphere. Blue is scattered more than any other colors because it travels as shorter, small waves. This is why we see a

Why is the sky blue? - 59044252 Answer: The blue color of the sky is primarily due to a phenomenon known as Rayleigh scattering. Explanation: Here's a simplified explanation: 1. Sunlight Composition:

To an astronaut, the sky looks dark and black instead of blue because there is no atmosphere containing air in the outer space to scatter sunlight. So, there is no scattered light to reach our eyes

Answer: Blue light is scattered in all directions by the tiny molecules of air in Earth's atmosphere. Blue is scattered more than other colors because it travels as shorter, smaller waves. This is why we see a

Explanation: The clear sky appears blue because the molecules in the Earth's atmosphere scatter blue light from the sun more than other colours, due to its shorter wavelength, a phenomenon called

The sky is blue because the atmosphere scatters sunlight. Light with shorter wavelengths (blue, purple, violet) is scattered more in the atmosphere, so the sky appears blue; this is the same ...

The sky appears white instead of blue when there are thick clouds covering the atmosphere, scattering sunlight in all directions. This scattering of light by water droplets or ice crystals in the ...

This is why we see a blue sky most of the time. The sky appears blue to us because of the scattering of the blue light component of the light from the Sun.

This is why the sky looks reddish during these times. In summary, the sky appears blue because shorter wavelengths of light (blue) scatter more effectively in all directions, and our eyes are more attuned to

Why is the colour of the sky blue? Particles and gases in the Earth's atmosphere scatter sunlight in every direction. Blue light is much more scattered than any other colour because it propagates as
